In your letter of November 30, 1953, you asked for a special 35mm Pan Kodalith Stripping Film on thinner base, and we discussed this matter several times on the telephone. We have been able to coat this emulsion on a support of about .00325" thickness, which with the stripping layer and emulsion totals about .00425" in thickness. We are sending you five 35mm by 100-foot rolls of this film, spooled on wood cores (darkroom loading required), at no charge.

We have avoided the use of an antihalation backing as it is objectionable for 35mm films, and have used instead a gray dye in the support. If the film is examined after processing but before stripping, the density of this dye will be observed and should not be confused with fog. Otherwise, the film can be processed and stripped by the same procedures you have been using on other similar material. This experimental sample has a slight but definite longitudinal streakiness. This streakiness is apparent in uniform medium density areas but does not seem to be evident when used for line copy work. We should appreciate any comments regarding this material after you have had a chance to test it.

As we discussed on the telephone, we can give no assurance that we can duplicate experimental materials of this type. However, if the material is satisfactory for your purpose and you should need additional quantities, we should be pleased to try to make it for you.

We have shipped the film to your home and trust this is a satisfactory procedure.

With best regards,

Yours very truly, .
